A. Operational Clocks & Anchor-Eligible Decision Boundary

MATHEMATICAL RISK SET FORMULATION (§2.3):

- Evaluated Base Set ($\mathcal{R}$): $\mathcal{R} = \{(i,t) : i \in \mathcal{C},\ t \in \mathcal{T}_i,\ t < T_{S3,i}\}$ (97,700 windows across 8,254 stays)
- Anticipation Label ($H = 6$h): $Y_i(t; 6h) = \mathbf{1}\{t < T_{S3,i} \le t + 6h\}$ (678 pos / 97,022 neg; prevalence $\pi = 0.694\%$)
- Anchor-Restricted Risk Sets: $\mathcal{R}_\delta^{(C)} = \{(i,t) \in \mathcal{R} : t + \delta \le C_i\}$
  - — Exploratory Hybrid Analysis ($C_i = T_{susp}$ for cases, $T_{Rx,start}$ for controls): $\mathcal{R}_0^{hybrid} = 70,192$; $\mathcal{R}_2^{hybrid} = 70,129$ windows
  - — Uniform Earliest-Rx Analysis ($C_i = T_{Rx,start}$ for all stays): $\mathcal{R}_0^{Rx} = 65,926$; $\mathcal{R}_2^{Rx} = 65,877$ windows ($N_+ = 0$, non-estimable)

B. Population Opportunity Attrition
